Top 5 highlights of the EPO annual review 2021

Article written by trainee Patent Attorney Karen Rodriguez

As every year, the European Patent Office published a highly informative and extensive report on the 2021 statistics and trends: the Patent Index 2021. This index reveals remarkable trends, for example a massive increase of 24% of applications from People's Republic of China in the digital communication field; and an overall increase of 4.5% of European applications, resulting in a total of 188,600 filings.

In this article, we approach the five most noteworthy topics from the statistics and trends in 2021. Our special focus is on medical technology and healthcare, which is one of the fields that has been consistently at the top.

#5 The general impression: an increase on the demand of European patents EPO emphasizes a resurge of the yearly increase in the number of patent applications seen before the start of the pandemic, which is around 4.5% every year. In 2020, the number of patent applications stayed somewhat constant, showing a drop of only 0.6% (comparable to the 0.4%)

drop in 2016 and to the 0.4% drop in 2013). The fluctuations above seem to correlate with the demand from the US, which decreased by 5.9% in 2016 and by 3.9% in 2013. Possible reasons on these declines include changes in the US patent law in 2013 and 2016 and the steps made towards the unitary patent between 2012 and 2013. Past year

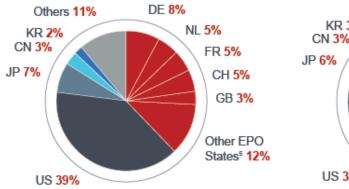

was not the exception, applications with origin in the US increased by 5.2% in 2021.

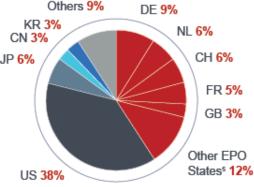

#4 Steady number of applications in medical technology

Regarding medical technology, the total number of patent applications increased by a modest 0.8% (128 more applications) relative to 2020. US applicants filed almost as many applications as applicants from all EPO member states together, that is about 38% from the 15,321 applications received by the EPO in 2021. Interestingly, global brands (e.g., Philips, Medtronic, J&J, Boston Scientific, etc.) only account for 19% of the total applications, indicating a great diversity of subfields and large participation of European and American SMEs, individual inventors, Universities, and public research organisations. This trend is observed in many technical fields. For example, from the applicants based in Europe, 59% belong to one of these "small" groups, even if they contribute only 25% of the total applications filed at the EPO.

Leading countries in Medical Technology (figures by EPO)

2020 2021

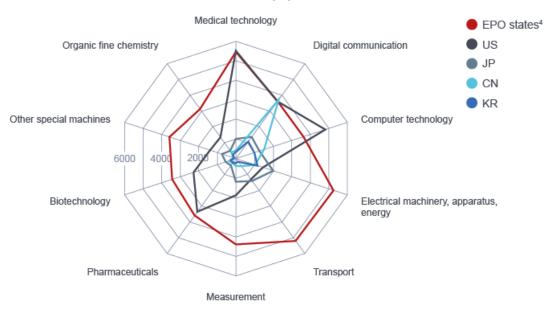

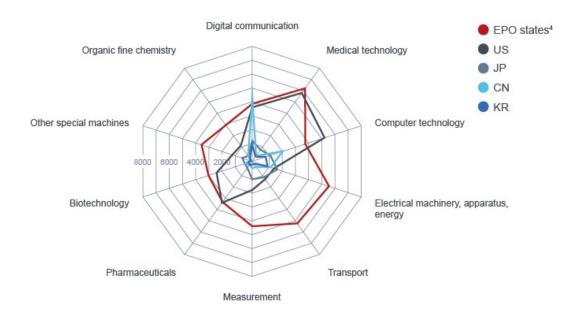

The highest numbers of applications filed by US and European applicants in both 2020 and 2021 were in the medical technology field (almost 6,000 each entity each year). Over the last 10 years, the increase rate of patent applications (about 250 patent applications per year) with US and European origin has been slightly higher than the increase rate of patent applications in digital communications from the same jurisdictions. In fact, **since 2016 the highest contribution from EPO member states has been in medical technology**. This is not so evident in the overall trends due to the powerful position of Asia regarding digital communication and computer technology. In general, the strongest Asian countries (e.g., Japan, China, and South Korea) accounted for only 12% of the share of patent applications in medical technology at the EPO. This small share indicates that Asian countries have a different market focus than European and US companies.

Number of patent applications in Medical Technology from leading countries (figures by EPO)

2020

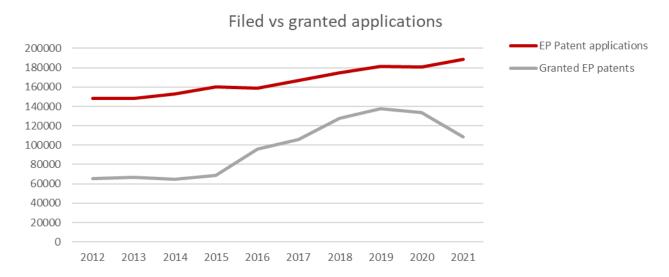

2021

#3 Big decline in granted patents

A different history can be told by looking at the number of granted patents, which in 2021 decreased by 18.6 %, that is 24,910 less than in 2020. This decrease likely marks the end of the extraordinary efforts from the EPO to reduce its backlog of applications since 2014, that produced an impressive increase of almost 95% in granted patents between 2015 and 2020. The decrease of granted patents can be observed across all fields. In the case of medical technology, the number of granted patents dropped by 19% in 2021. According to the EPO, search and examination timeliness are 4.8 and 23 months, respectively, suggesting that the intention to grant is given around 2.3 years after the application, an indicator that has not changed much in the last few years but decreased by approximately one month in comparison to the previous decade (2010's).

Medical technology is not one field

The EPO categorised medical technology as a subcategory within the Instruments field. However, there is no strict definition of medical technologies in the official patent classification systems (i.e., CPC, IPC). Everyone working in or nearby the medical field is well aware that medical innovations are typically the result of multidisciplinary efforts. Progress made in any of the other technical fields can open a new door for medical devices. Many examples can be given. One of them is the patent applications in audio-visual technology that increased by 24% in 2021 (from 4,388 to 5,440 applications), which led to e.g., faster, and more efficient telemedicine, which pretty much accelerated in the last couple of years. Another example is found in additive manufacturing that have found their way to healthcare. According to a news article from the EPO in 2020, the medical and health sector have generated the largest number of European patent applications in 3D printing in the last decade, with 907 filings in 2018. A quick search in Espacenet including the A61 (medical or veterinary science; hygiene) and B33 (Additive manufacturing) classifications finds 1081 publications only in 2021, giving a glance of the vast development on additive manufacturing for healthcare. This is not to mention other specialties like electronics and robotics that directly enhance medical technology; and of course, artificial intelligence, which has allowed healthcare to move towards a data-driven industry.

#2 New topic: gender gap in the inventors' statistics

A new topic mentioned by the EPO this year was the role of women as inventors. They reported that in patent applications with at least one inventor based in Europe, roughly 20-21% named one or more women as inventors. They stated that some progress has been made in the last 30 years as the same indicator was 7% in 1990.

A slightly different perspective can be observed depending on the technology field. During the last International women's day, the EPO wrote a special <u>article</u> based on the <u>WIPO's IP Statistics and Data Centre</u>. According to the WIPO, in 2021 the proportion of applications with at least one woman inventor was 50% or more in the fields of biotechnology, pharmaceuticals, organic fine chemistry, food chemistry and analysis of biological materials. In the case of medical technology this proportion was 33%.

In the patent index 2021, the EPO cited <u>Eurostat</u> and the <u>AEI</u> to report an almost equal proportion of women and men in tertiary education in Europe and US in the last years. The EPO suggested that women are more involved in expanding-knowledge fields like astronomy, psychology, or sociology than in technical fields like physics, chemistry, or engineering. Concluding that these women are more likely to publish academic papers than patents. However, female authors do not seem to account for 50% of the authorship in high impact journals. A <u>study</u> published in the British Medical Journal, shows that the number of female first, last and corresponding author remains below 46% in manuscripts between 2018 and middle 2021, in medical and neuroscience journals. Another <u>note</u> in the Nature website highlights that between 2005 and 2017 women accounted for roughly 25% of first authors in Nature and Science and just over 35% of first authors in PNAS (Proceedings of the National Academy of Sciences). These figures give a glance that in terms of gender gap in both inventorship and knowledge, there is still long way to go. On the same segment, the EPO announces a full study, with more detailed information by technology field later this summer.

#1 The Netherlands 4th runner up in Europe

According to the EPO, the Netherlands is positioned in 8th place in the world and 4th place in Europe, in filing European patent applications. This corresponds to 3% (6,581) of the total number of applications in 2021. Given its small population, this 3% disposes the Netherlands in 4th place if we consider the ratio of European patent applications per million inhabitants, after Switzerland, Sweden and Denmark. Important Dutch applicants are Royal Philips, Signify, and ASML.

The biggest share of the number of applications from the Netherlands in 2021 was in medical technology (13.4%), positioning the country in 4th place in the world with 884 European patent applications, after US, Germany, and Japan. This number increased by 3.6% from 2020 to 2021, breaking a new record since 2016. Obviously, many of those applications (653) originated in Philips, which made the Dutch company the most relevant applicant in the world in the medical field in 2021, after being 3rd in 2020. However, these numbers also reveal that the non-Philips Dutch filings in the medical technology field decreased by 12.4% in 2021, suggesting less applications from other known companies but also SMEs, Universities, etc. possibly because of the COVID-19 crisis.

Home-take messages

- US and EPO members in an intense competition in the European market regarding medical technology.
- A decrease of EP granted patents may indicate a release of the backlog on search and examination procedures by the EPO.
- Increase of women as inventors, yet the numbers call for improvement.
- Time to support medium and small companies developing medical devices.

European Patent Office's press release can be found on their <u>website</u>. Also, a nice <u>video</u> by the EPO presents briefly the most important trends of last year. Key figures can also be found in single page form.
